Introduction

The ADV7180 is available in four packages, 64-pin LQFP, 48-pin LQFP, 40-pin LFCSP and 32-pin LFCSP. The EVAL-ADV7180LFEBZ employs the 40-pin LFCSP packaged decoder, the EVAL-ADV7180LQEBCZ employs the 64-pin LQFP packaged decoder, the EVAL-ADV7180-32EBZ employs the 32-pin LFCSP packaged decoder and the EVAL-ADV7180-48EBZ employs the 48-pin LQFP package. This application note is intended to provide application support for the ADV7180 evaluation boards. This document contains a description of the evaluation kit and the evaluation boards. It also provides details on setup and configuration for evaluation.

Evaluation Kit

Each ADV7180EB evaluation kit consists of the following:

- ADV7180 Evaluation board
- ADV7180 Evaluation Kit CD
- I2C Download cable with USB port connector.
- 7V DC Power Supply Module.

Initial Configuration.

Register Control Software

1. Install the Register Control software from the evaluation CD. (Please refer to the Installation Guide on the evaluation CD for step-by-step instructions.)
2. Once the software is installed, power up the board and connect the USB connector.
3. Start the application (*START>PROGRAM>.ADVREGISTER CONTROL >ADVREGISTER CONTROL 3.56*).

The ADV Register Program Configuration screen appears, as shown in Figure 1

EVAL-ADV7180EB Application Note	Video Group Limerick
Rev.D October 2010	Analog Devices B.V. 3 of 67

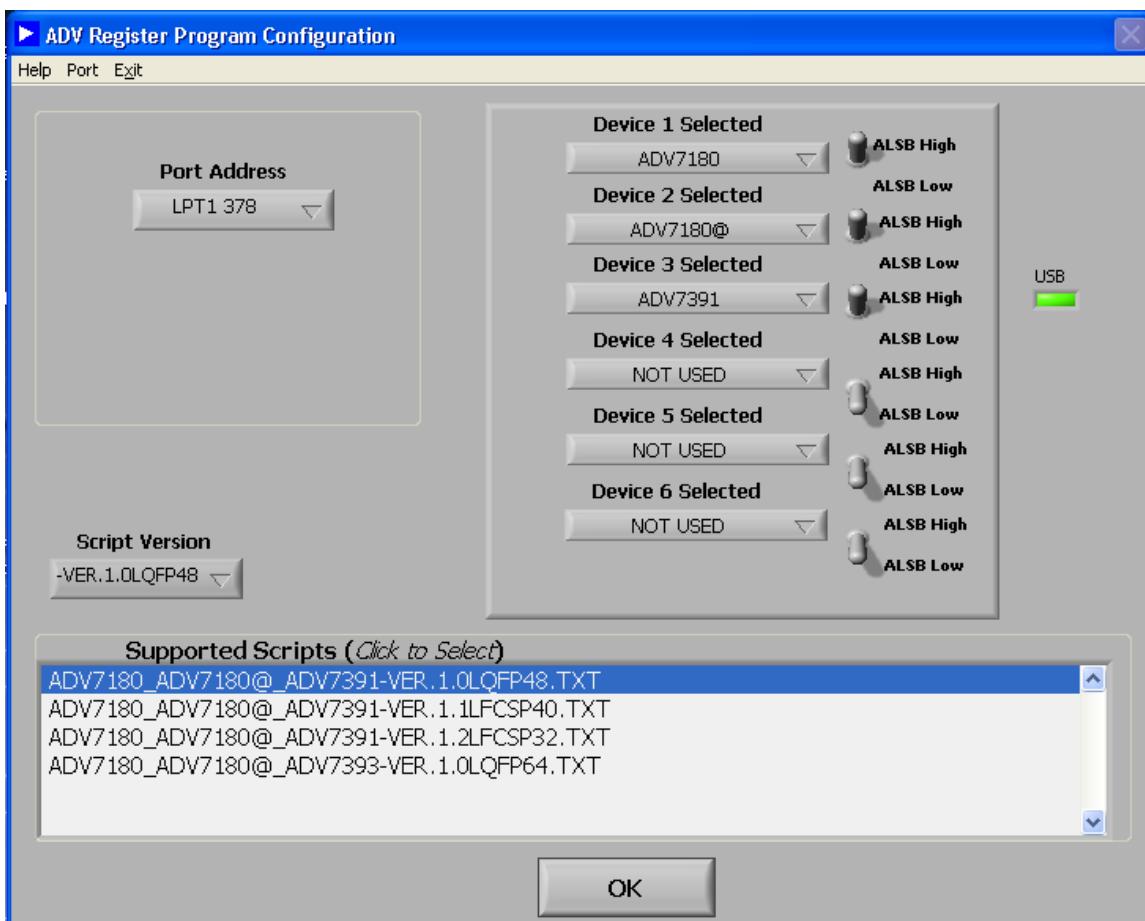

Figure 1. ADV Register Software Configuration.

4. Ensure the options are set, as shown in Figure 1, and click on the OK button. When the register control software starts, it firstly initializes all the selected devices and then loads the reset defaults for each device. I²C control and reset signals are connected to the evaluation board through the USB cable. This cable should be connected to the evaluation board before the application software is started.

Configuring ADV7180 Modes Using Script Files

To enable easy and efficient evaluation, the ADV Register Control software is provided with script files that can be used to program the evaluation board's decoder and encoder into preset configurations. Figure 2 illustrates how a script file can be accessed and selected from the drop down menu

Board-Level Description.

There is an evaluation board for each package type. The primary features of the boards and their positions are marked in Figure 3, Figure 4 and Figure 5.

Do not connect CVBS, S-Video, YPrPb simultaneously when using the EVAL-ADV7180LFEBZ and the EVAL-ADV7180-32EBZ, as they share the three analog inputs to the decoder.

Schematics

This section provides detailed schematic of the ADV7180 evaluation boards.

Figure 26 to Figure 49 provides layout information for the boards. Table 1 to Table 4 list the current BOMs.
